

Moment of time

Gaussian

$$A \cdot e^{-(x-B)^2/C^2}$$

A, B, C

Selection of an Optimal Range for Gaussian Approximation of original Spectra and Coefficient Extraction for each moment of time

Utilizing different ML Time Forecasting technics to determine most suitable for forecasting A, B, C further

Choosing the best regressor and polynomial degree

The PolynomialFeatures model emerges as the optimal choice for forecasting the coefficients (A, B, C) of our Gaussian approximations. Conduct a systematic analysis by running the model with 30 distinct regressors and varying polynomial degrees 2..9.

As result obtain luminescence degradation of Ag₂S quantum dots
